

Conserve™ Plus

GRAIN PROTECTOR

Conserve™ Plus offers grain growers unprecedented flexibility to store cereal grains on farm, whilst delivering robust grain protection.

Conserve Plus Grain Protector is the next generation grain protectant combining the powerful active ingredients, spinosad and s-methoprene.

Grain growers with experience using Conserve On-Farm know the power and endurance of spinosad to manage key storage pests, including resistant lesser grain borer. Conserve Plus takes this confidence in protection to the next level, by increasing the dose of both active ingredients.

Conserve Plus is a grain protectant. When applied to cereal grains it controls insects as they invade or emerge within grain during storage.

Grain protectants are never to be used for disinfecting grain. If live insects are detected prior to out-turn, fumigation is advised in a sealed silo.

Flexibility provided by Conserve Plus is a real advancement; Conserve Plus:

- Allows treatment of all cereals, including malt barley and maize
- Is available in new pack sizes to suit all enterprises, from 50 to 500 T
- Has a 24 hr WHP

Conserve Plus is registered for control of the four key stored grain pests, but does not control grain weevils. As rice weevil is a common insect across eastern Australian grain storages, Dow AgroSciences recommends that all Conserve Plus applications, are tank mixed with a partner organophosphate (OP).

Conserve Plus is widely compatible with OP's such as Reldan Grain Protector or Sumithion®1000 (fenitrothion), both of which control grain weevils. When used on malt barley and maize, Conserve Plus must be mixed with fenitrothion.

Conserve Plus has a 24 hr WHP when partnered with Reldan Grain Protector. A longer WHP applies when mixing with fenitrothion at the 1.2

L/100 L rate. This rate is suggested when planning to store malt barley or maize for more than three months.

The sale and use of Conserve Plus is managed by a stewardship program. This program ensures that only one Conserve product containing spinosad, is applied to any parcel of grain as it passes through the supply chain. Accredited agents verify grain growers eligibility to purchase Conserve Plus, by sighting their NGR card number, and signing an End User Declaration (EUD) to acknowledge they understand and agree to the conditions of use.

Conserve Plus:

- Contains spinosad 100 g/L + 100 g/L S-methoprene
- Controls all stored grain insect pests, other than grain weevils, which are controlled by a partner OP such as Reldan Grain Protector or Sumithion 1000
- Has a 24 hr WHP (when mixed with Reldan Grain Protector)
- Is registered for use on all cereals (when partnered with fenitrothion)
- Provides up to 9 months protection
- Is available in a 50 T (500 ml) or 500 T (5 L) pack size, suiting small or large-scale storages.
